The invention relates to human cardiovascular system related polypeptides and the polymucleotides encoding them. The polypeptides, polymucleotides and antibodies to the polypeptides are useful for diagnosing a and antibodies to the polypeptides are useful for diagnosing a pathological condition or a susceptibility to a pathological condition, for preventing, treating, or ameliorating a medical condition, such as cancer of cardiovascular system tissues, proliferative disorders, feetal and developmental abnormalities, haematopoietic disorders, disease of the immune system, AIDS, autoimmune diseases (e.g., rheumatoid arthritis), inflammation, allergies, neurological disorders (e.g., Alzheimer's disease, Parkinson's disease), cognitive disorders, cardiovascular disorders, angiogenic disorders, atherosclerosis, cardiovascular disorders, angiogenic disorders, and incorders, and incorders, and incorders, pregnancy-crelated disorders, machorine disorders and infections. The nucleic acids are also useful for chromosome identification, radiation hybrid mapping or long-range restriction mapping. The polypeptides and polymucleotides are also useful for chromosome identification, radiation hybrid mapping or long-range capabilities, fat content or other mutritional components. This sequence represents a human cardiovascular system
                                                                                                                                                                                                                                                                                                                               New cardiovascular system related polynuclectides and polypeptides, useful for preventing, treating, or ameliorating a medical condition, such as cancer of cardiovascular tissues and cancer metastases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

UYPV1M
noncapsid protein NS1 - minute virus of mice
c) Species: minute virus of mice, murine parvovirus
C) Species: minute virus of mice, murine parvovirus
C) Date: 14-Nov-1983 #sequence_revision 28-Aug-1985 #text_change 08-Apr-1994
C) Accession: A03696
C) Accession: A03696
A) Title: The complete DNA sequence of minute virus of mice, an autonomous parvovirus.
A) Recession: A03696
A) MUD: 83143341; PMID: 6298737
A) Accession: A03696
A) MUD: 83143341; PMID: 6298737
A) Accession: A03696
C) Subperfamily: parvovirus noncapsid protein
C) Keywords: noncapsid protein

G190104

putative tetrameric tRNA splicing endonuclease [imported] - Guillardia theta nucleomorph
G190104

putative tetrameric tRNA splicing endonuclease [imported] - Guillardia theta
G190104

A,Note: a nucleomorph G111ardia theta
A,Note: a nucleomorph is the vestigial nucleus of a eukaryotic endosymbiont
G190104

"DNA sequence comparison between two tissue-specific variants of the autonomous parvovirus, minute virus of mice.";
Nucleic Acids Res. 13:367-1088).
-i- FUNCTION: Seems necessary for viral DNA replication.
-i- SIMILARITY: Belongs to the parvoviruses noncapsid protein family.
                                                                                                                                                                                                                                             Virology 192:339-345(1993).
-1- FUNCTION: Seems necessary for viral DNA replication.
-1- SIMILARITY: Belongs to the parvoviruses noncapsid protein family.

MEDLINE=1000 of the Aresse strain of porcine parvovirus:

"Genome organization of the Kresse strain of porcine parvovirus:
identification of the allotropic determinant and comparison with
those of NADL-2 and field isolates.";
J. Virol. 70:2508-2515(1996).

-I- FUNCTION: Seems necessary for viral DNA replication.
                                                                                                                                                                                                                                                                                                                                                   Porcine parvovirus (strain Kresse) (PPV).

-1- FUNCTION: Seems necessary for viral DNA replication.
-1- SIMILARITY: Belongs to the parvoviruses noncapsid protein family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Martyn J.C., Davidson B.E., Studdert M.J.;
"Nucleotide sequence of feline panleukopenia virus: comparison with
canine parvovirus identifies host-specific differences.";
J. Gen. Virol. 71:2747-2753(1990).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           "Mapping specific functions in the capsid structure of canine
parvovirus and feline panleukopenia virus using infectious plasmid
                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              "Construction and nucleotide sequence analysis of an infectious DNA clone of the autonomous parvovirus, mink enteritis virus.";
J. den. Virol. 72:867-875(1991).
-!- FUNCTION: Seems necessary for viral DNA replication.
-!- SIMILARITY: Belongs to the parvoviruses noncapsid protein family.

Homeobox protein SIX6 (Sine oculis homeobox homolog 6) (Optic homeobox protein Drotein OPTX2).
1 (Homeodomain protein OPTX2).
2) (Homeodomain protein OPTX2).
3 IX6 OR OPTX2 OR SIX9.
3 SIX6 OR OPTX2 OR SIX9.
4 SIX6 OR OPTX2 OR SIX9.
5 SIX6 OR OPTX2 OR SIX9.
                                                                                                                                                                                                                                                                                                                                                        Parrish C.R.;
Submitted (AUG-1990) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Seems necessary for viral DNA replication.
-!- SIMILARITY: Belongs to the parvoviruses noncapsid protein family.
                                                                                                                                                                                           MEDLINE=88062992; PubMed=2824850;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              "Silver project.";
Submitted (APR-2000) to the EMBL/GenBank/DDBJ databases.
submitted (APR-2000) to the EMBL/GenBank/DDBJ databases.
-!- FUNCIION: May be involved in eye development.
-!- SUBCELLULAR LOCATION: Nuclear (By similarity).
-!- TISSUB SPECIFICITY: Expressed in the developing and adult retina.
Also expressed in the hypothalamic and the pituitary regions.
-!- SIMILARITY: Belongs to the SIX/Sine oculis homeobox family.
-!- SIMILARITY: Contains 1 homeobox domain.

"Six9 (Optx2), a new member of the Six gene family of transcription factors, is expressed at early stages of vertebrate ocular and factors, is expressed at early stages of vertebrate ocular and mech. Dev. 83:155-159(1999).

T pituitary development.";
Mech. Dev. 83:155-159(1999).

- I- FUNCTION: May be involved in eye development.

- SUBCELLUIAR LOCATION: Nuclear (By similarity).

- ITSSUE SPECIFICITY: In the developing embryo, expressed mainly in the ventral optic stalk, optic chiasma, the neural retina and the primordial tissues that give rise to the pituitary/hypothalamus axis. Not expressed in the lens placede.

- DEVELOPMENTAL STAGE: Expression is first detected in the embryo at

Isold=060423-2; Sequence=VSP 007304; SIMILARITY: Belongs to the cation transport ATPases family (P-type ATPases). Subfamily IV.
CAUTION: Ref.1 (AAM33179) sequence differs from that shown due to presence of unspliced intronic sequence in the C-terminus.
CAUTION: Ref.2 sequence differs from that shown due to erroneous

gene model prediction.

Sequence 11397, Application US/09489039A

Patent No. 6610836

GENERAL INFORMATION:
APPLICANT: Gary Breton et. al
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO KLEBSIELLA
TITLE OF INVENTION: NUCLEIC ACID AND THERAPEUTICS
FILE REFERENCE: 2709.2004001
FILE REFERENCE: 2709.2004001
CURRENT APPLICATION NUMBER: US/09/489,039A
CURRENT FILING DATE: 2000-01-27
PRIOR FILING DATE: 1999-01-29
NUMBER OF SEQ ID NOS: 14342
SEQ ID NO 11397
LENGTH: 203
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 1429, Application US/09489039A

Sequence 11, Application US/09280597

Patent No. 668206

GENERAL INFORMATION:
APPLICANT: Schlessinger, Joseph
APPLICANT: Schlessinger, Joseph
APPLICANT: SAP, Jan M.
TITLE OF INVENTION: PHOSPHATASE-ALPHA
ITILE OF INVENTION: PHOSPHATASE-ALPHA
NUMBER OF SEQUENCE: 14
CORRESPONDENCE ADDRESS:
ADDRESSEE: PENNIE & EDMONDS
STREET: 1155 AVENUE OF THE AMERICAS
CITY: NEW YORK
STREET: 1155 AVENUE OF THE AMERICAS
COUNTRY: U.S.A.
ZIP: 10036
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC Compatible
COMPATING SYSTEM: PC-DOS/MS-DOS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DB 1; Length 233;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      7; Indels

US-09-540-236-2794

US-09-540-236-2794

Sequence 2794, Application US/09540236

Patent No. 6673910

GENERAL INFORMATION:

TITLE OF INVENTION: NUCLEIC ACID AND THERAPEUTICS

TITLE OF INVENTION: FOR DIAGNOSTICS AND THERAPEUTICS

FILE REFERENCE: 2709.2005-001

CURRENT APPLICATION UNMER: US/09/540,236

CURRENT PILING DATE: 2000-04-04

NUMBER OF SEQ ID NOS: 3840

APPLICANT: Zhou Yihua
APPLICANT: Cao Yongwei
TITLE OF INVENTION: Soy Nucleic Acid Molecules and Other Molecules Associated With
TITLE OF INVENTION: Plants and Uses Thereof for Plant Improvement
FILE REFERENCE: 38-21(5:223)B
CURRENT FILING DATE: 2003-04-28
NUMBER OF SEQ ID NOS: 285684
SEQ ID NO 149096
LENGTH: 187
PRIOR APPLICATION NUMBER: 60/220,963
PRIOR FILING DATE: 2000-07-26
PRIOR FILING DATE: 2000-07-11
PRIOR FILING DATE: 2000-07-11

The sequence below corresponds to the plus (+) strand, also referred to as the C-strand. The minus (-) strand is also referred to as the V-strand.

To as the V-strand.

The 3' and 5' termini both exhibit the potential for forming stable 'fold-back' hairpins; these sequences appear to play a role in replication [1].

The left and right halves of the genome encode two distinct, but overlapping transcriptional unite. The transcripts can be summarized [1] (1 map unit (mu) = 51 bp):

R1 (48 kb): 4.5 mu - 46 mu; 46+ mu - 95 mu R2 (3.3 kb): 4.5 mu - 10.7 mu; 38 mu - 46 mu; 46+ mu - 95 mu R3 (3.0 kb): 4.0 mu - 46 mu; 46+ mu - 95 mu R3 (3.0 kb): 4.0 mu - 46 mu; 46+ mu - 95 mu R3 (3.0 kb): 4.0 mu - 10.7 mu; 38 mu - 46 mu; 46+ mu - 95 mu R3 (3.0 kb): 4.5 mu - 10.7 mu; 38 mu - 46 mu; 46+ mu - 95 mu R3 (3.0 kb): 4.5 mu - 10.7 mu; 38 mu - 46 mu; 46+ mu - 95 mu R3 (3.0 kb): 4.5 mu - 10.7 mu; 38 mu - 46 mu; 46+ mu - 95 mu R3 (3.0 kb): 4.5 mu - 10.7 mu; 38 mu - 46 mu; 46+ mu - 95 mu R3 (3.0 kb): 4.5 mu - 10.7 mu; 38 mu - 46 mu; 46+ mu - 95 mu R3 (3.0 kb): 4.5 mu - 10.7 mu; 38 mu - 46 mu; 46+ mu - 95 mu R3 (3.0 kb): 4.5 mu - 10.7 mu; 38 mu - 46 mu; 46+ mu - 95 mu R3 (3.0 kb): 4.5 mu - 10.7 mu; 38 mu - 46 mu; 46+ mu - 95 mu R3 (3.0 kb): 4.5 mu - 10.7 mu; 38 mu - 46 mu; 46+ mu - 95 mu R3 (3.0 kb): 4.5 mu - 10.7 mu; 38 mu - 46 mu; 46+ mu - 95 mu R3 (3.0 kb): 4.5 mu - 10.7 mu; 38 mu - 46 mu; 46+ mu - 95 mu R3 (3.0 kb): 4.5 mu - 10.7 mu; 38 mu - 46 mu; 46+ mu - 95 mu R3 (3.0 kb): 4.5 mu - 10.7 mu; 38 mu - 46 mu; 46+ mu - 95 mu R3 (3.0 kb): 4.5 mu - 10.7 mu; 38 mu - 46 mu; 46+ mu - 95 mu

The parvoviriate family cantains two groups that infect mammalian hosts: (i) defective (helper-dependent) adeno-associated viruses, and (ii) autonomous (helper-independent) parvoviruses. MVM is a member of the latter group. Both groups have been demonstrated to package both plus and minus strands (in separate particles) of the ss-DNA genome, though the minus strand is more typically packaged in the latter group.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Morgan,W.R. and Ward,D.C.
Three splicing patterns are used to excise the small intron common to all minute virus of mice RNAs
